

Uniqueness and advantages of jade

1. In contrast to any other sauna stones, jade will serve you for at least 5 years. It is absolutely safe to use it in saunas, as it has very high firmness and durability indicators.
2. Has no reaction to acids and purifies air.
3. Jade is not of volcanic origin. It is a semi-precious stone whose chemical and physical features determine that the stone is extremely resistant to high temperatures and in interaction with water (in temperature of 100 degrees) it emits silicic acid that has analgesic, anti-toxic and anti-inflammatory effects.
4. Jade keeps the heat for a longer time and gives it away gradually.
5. The heated stone releases a very light, soft and refreshing steam that does not impede respiration and does not burn the body.
6. Scientific research has proven that jade has special healing properties, as it:
 - Normalizes blood pressure
 - Strengthens and improves activities of the nervous system
 - Cleans the kidneys and improves the function of the urethra
 - Improves male potency
 - Strengthens blood vessel walls
 - Due to emitted silicic acid it cleans lungs and helps to maintain the lost quantities of silicic acid in a body that is necessary for normal functioning of a body.
7. Jade is a very clean stone containing the least harmful impurities (sulphur, phosphorus compounds) from all stones that are used in saunas. Moreover, it contains many chemical elements that are useful for a human body. Its density is 3.43 g/cm³, crushing strength is 3640 – 9320 cm², melting point is 1040 – 1060° C and water absorption is 0.3 – 0.5%.
8. Rare and beautiful, of green or greyish colour. Its sources are limited worldwide, it is extracted manually and is treated with especially hard minerals.
